

INTROVERT

1. The Overall Vision: What is Introvert?

Introvert is a privacy-first, fully decentralized peer-to-peer (P2P) communication and data-syncing platform.

Unlike traditional apps that store your messages, files, and identity on centralized corporate servers (like AWS or Google Cloud), **Introvert stores 100% of your private data exclusively on your own devices** (e.g., your phone and laptop).

The Core Value Proposition

- **Zero Trust, Zero Footprint:** No centralized databases mean there's nothing to hack, leak, or sell.
- **Instant Worldwide Syncing:** Devices bypass firewalls automatically using a custom "Relay-First, Hole-Punch Second" networking model. Connections feel instant, but data transfers directly between users.
- **Incentivized Participation:** Users who support the network by acting as reliable nodes or routing data are rewarded directly via a decentralized token ecosystem.

2. Where We Are at & What is Pending (3rd May 2026)

● What We Have Already Built (The Foundations)

A. Advanced Networking Infrastructure

We have built and deployed a permanent **Root Bootstrap Node (RBN)** on an Alibaba Cloud server. This server functions as the network's "phonebook" and signaling point. It uses less than 6 MB of storage to connect tens of thousands of users without ever seeing their private encrypted data.

B. The Core Syncing Engine

Our native engine—written in **Rust** for maximum speed and memory safety—is operational. It features:

- **libp2p NAT Traversal:** Advanced hole punching that lets your home computer talk directly to your phone on cellular data.
- **Encrypted On-Device Databases:** Using localized, highly secure databases to keep keys and message histories safe on disk.

C. Cross-Platform App

The mobile and desktop user interface is built using **Flutter**. We have successfully bridged the fast Rust backend directly into the frontend, making the app run natively on **Linux, Android, and iOS**.

● What is Pending (The Roadmap to Launch)

To achieve our ultimate vision, our next engineering and business phases focus on the following four milestones:

Milestone 1: Finalize a Stable, Functional Product

- **Direct Sync Optimization:** We are stress-testing and fine-tuning direct device-to-device connections on restrictive mobile networks to ensure syncing is seamless under any condition.
- **End-User Polishing:** Finalizing the blueprint-themed visual interface to make joining the decentralized network as easy as downloading a normal messaging app.

Milestone 2: Build & Audit the Rewards System

- **Decentralized Tracking:** We need to finalize the code that tracks node uptime and data routing via cryptographic digital receipts, without relying on a central server.
- **The Claim Engine:** Developing the calculation model that bundles daily activity into a lightweight summary (Merkle Tree). Users can securely claim their incentives whenever they want with minimal network strain.

Milestone 3: Invite-Only Beta & Web Presence

- **Website & PR:** Launching a sleek, technical website explaining the underlying tech, alongside a press kit for early investors and tech communities.
- **Invite-Only Testnet (1,000 Users):** Onboarding an initial cohort of 1,000 private testers via invite codes to stress-test our cloud bootstrap node and gather feedback on sync speeds.

Milestone 4: Mainnet Launch & Token Generation (TGE)

- **Token Launch:** Partnering with professional launchpads and teams specializing in Initial Coin Offerings (ICOs) or Token Generation Events.
- **Mainnet Deployment:** Deploying the finalized rewards architecture on a secure blockchain layer to officially launch the token and open the network to the public.
